(57) ABSTRACT

A container of the present invention may include a base, a lip extending around the periphery of the base, a perforation defined by the lip, and a lid adhered to the lip, wherein the lid includes a first undercut, wherein the first undercut overlaps the perforation. The perforation and undercut allow for a portion of the lid to remain on the lip after the lid has been opened. The portion remaining on the lid may include an outwardly facing adhesive surface, configured to adhere to the lid to reseal the lid to the base once the lid is closed after the initial opening. As such, the lid is permanently adhered to a first portion of the lip and resealably adhered to a second portion of the lip. The first portion may be an outer lip portion and the second portion may be an inner lip portion.
